Date:	05/01/2020	Part:	Thermal Barrier Coated Piston Upgrade

5.9L-6.7L Cummins Thermal Barrier Coated Piston Upgrade

With the thermal barrier coating in the dish, it protects the piston dish against possible overheat and melting conditions found in today's high exhaust gas temperature applications.

With the Teflon coating on the skirt, there is less friction at start up. Cylinder wall and piston skirt scuffing and gaulding are greatly reduced. It's used in all performance applications and is particularly used by Cummins in all high horsepower and some marine applications.

Available for all 5.9L 24V Common Rail Engines 2003 and up. Various 6.7L 24V Common Rail Engines (Piston Kit 4956007).
